General wordpress link filter

c# jquery java html5 php python
ruby xml xcode **português**
python laravel mysql c++ objective-c

everyone! I need to add the domain prefix www, not to write by hand, each filter as post_link, page_link, category_link and so on - there is a global filter to all urls added www. Methods of how to change the general settings in the site url in the database or change options or htaccess - just do not fit. Thanks in advance for your reply.

If you can't change it via the wp-admin, you can use the following:

```
add_filter( 'post_link', array($this, 'changePermalinks'), 10, 3);
add_filter( 'page_link', array($this, 'changePermalinks'), 10, 3);
add_filter( 'post_type_link', array($this, 'changePermalinks'), 10, 3);
add_filter( 'category_link', array($this, 'changePermalinks'), 11, 3);
add_filter( 'tag_link', array($this, 'changePermalinks'), 10, 3);
add_filter( 'author_link', array($this, 'changePermalinks'), 11, 3);
add_filter( 'day_link', array($this, 'changePermalinks'), 11, 3);
add_filter( 'month_link', array($this, 'changePermalinks'), 11, 3);
add_filter( 'year_link', array($this, 'changePermalinks'), 11, 3);

function changePermalinks($permalink, $post) {

    if ( strpos($permalink, '://www.') ) return $permalink;

    return str_replace('://', '://www.', $permalink);
}
```

In your dashboard go to Settings -> General and the fourth and fifth option should be "WordPress Address (URL)" and "Site Address (URL)". Change the `http://example.com` to `http://www.example.com` and it should change all links.

- Thanks for your answer, but this solution is not for me. – [SergeevD](#) Feb 25 at 16:36
- Okay, can you explain why that isn't the solution? – [Howlin](#) Feb 25 at 16:48
- Because on our hosting this options is remove from admin panel. – [SergeevD](#) Feb 26 at 6:23
