basic .htaccess template

by prettyscripts (http://www.prettyscripts.com) on 2011-02-25 14:18

code (http://www.prettyscripts.com/code/)

.htaccess is a text file containing commands to control an entire website. i can never remember details what to put inside. this is just a basic template / skeleton for my web projects, so that i don't have to go all over places to look for what i want everytime i start a new project.

Code:

```
    Options +FollowSymLinks
    IndexIgnore *
    ServerSignature Off

    <Limit GET POST PUT>
        order allow, deny
        allow from all
        #deny from x.x.x.x
    </Limit>

    <Files .htaccess>
        order allow,deny
        deny from all
```

affili

```
        </Files>
```

notes

line 1: follow symbolic links. useful when i just link most frequently used files without having multiple copies everywhere.

line 2: do not allow directory listing, so that the world doesn't see your files.

line 8: block ip addresses from accessing your website.

lines 11-14: prevent people from viewing your .htaccess file.

lines 19-20: customized error pages.

lines 22-23: use directory or file if they exists

line 25: everything else, forward to index.php.
